Abstracts

Gallium is a metal that appears as gray orthogonal crystal in solid state and tin or silvery colored metal in the molten state. Gallium metal exists in a molten state at room temperature due to its relatively low melting point and high boiling point. It is soluble in acids and alkalis and partly soluble in mercury. It is produced as a by-product of the aluminum refining process. Gallium is also found in small traces in zinc ores and bauxite. Gallium is mixed with arsenic, phosphorus, and antimony to form compounds and alloys that exhibit semiconductor properties. It is mainly used as electrochemical material for semiconductors, photovoltaic cells, integrated circuits, and diodes. Based on the Gallium market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
