Abstracts

A gas engine is basically an internal combustion engine that generates impulse power by utilizing a variety of gases as fuel. The gas engine is usually applied as stationary continuous generation units but also operate as peaking plants and in greenhouses to meet fluctuations in limited electricity demand. The gas engine can be regulated with various types of gas, such as shale gas, natural gas, landfill gas, syngas and sewage gas. The gas engine can produce electricity in parallel with the local electricity grid, in island mode operation or for power generation in remote areas. The gas engine is designed for maximum electrical & thermal efficiency, high reliability & availability, and low operation & service costs.
