Abstracts

Gas turbines are combustion engines that can convert natural gas or other liquid fuels to mechanical energy which is then used by the generator to produce electrical energy. Most gas turbines operate on an open cycle in which air is drawn from the atmosphere. Gas turbines are composed of three primary sections which include a compressor, combustion mounted on the same shaft and turbine. Compressor draws air into the engine, pressurizes it and feeds it to the combustion chamber at speeds of hundreds of miles per hour. The combustion mechanism then produces high temperature gas stream that enters and expands through the turbine section. The turbine features an array of alternate stationary and rotating blades. Gas turbine services market is rapidly expanding in sectors where efficiency and power output of a gas turbine play crucial roles.

Based on the Gas Turbine Services market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
