## Abstracts

Gaskets and seals are mechanical components that prevent fluid leakage between two components and debris entry into engines. Between two non-mobile flat flanges, gaskets operate as a static seal. Rubber, nitrite, graphite, and neoprene are used to make them because they can withstand high compression rates. Seals, on the other hand, are used to keep two moving parts like shafts, pumps, and engine components from leaking. They're normally flat and spherical, with rubber inside surface and a metal ring on the outside. They are typically used to seal the hydraulic line at the shaft end to avoid leakage. Gaskets and seals both have a lot of flexibility, dependability, strength, and resistance to extreme heat.
