Abstracts

Glyphosate is applied to the leaves of plants to kill both broadleaf plants and grasses. These are used in crops as well as non-crop plants like turfs and ornamentals. It controls weed growth by interfering with the enzymatic production of certain amino acids that are essential for the growth of a broad spectrum of weeds and their entire root system. Urea is an organic compound chemically produced from the waste that the body creates after metabolizing protein. The synthetic version of this chemical compound can be created in the laboratory in the forms of liquid and/or solid, which is often used in fertilizers as a convenient source of nitrogen.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Glyphosate market covering all its essential aspects.
