Abstracts

Granulometer is a device used for the analysis of particle sizes of active ingredients and excipients used in the pharmaceutical industry. Particle characterization is one of the important physical characteristics to create pharmaceutical products as the size, distribution, and shape of the particles affects the product performance, bulk properties, stability, appearance of the end product, and its processability. Hence particle size analysis is an integral part of formulating and manufacturing pharmaceutical dosage forms. Also, product size distribution has an impact on the manufacturability of the solid oral dosage forms of the drug, including pre-mixing, granulation, milling, drying, blending, encapsulation, coating, and compression.

Based on the Granulometer market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
