Abstracts

Green hydrogen is created by using renewable energy sources rather than fossil fuels. There are many different colors that can be used to describe a colorless burning chemical. This can be a good and stable replacement for essential sources such as natural gas, coal, and oil in a wide range of applications. Green hydrogen is created when water is hydrolyzed with the help of electricity. These are derived from renewable energy sources such as wind and Steel Plant. The electrolysis, steam reforming, and fermentation are all typical methods for producing green hydrogen. This report studies green hydrogen production from electrolyzer.

The electrolyzer is a unit in which electricity can be used to convert water into hydrogen and oxygen, which can then be used to store energy for later use. The electrolyzer consists of an anode and a cathode separated by an electrolyte. The functions of different electrolyzers are slightly different, mainly due to the different types of electrolyte materials used. Electrolyzers have a wide range of

sizes, from small equipment sizes that are very suitable for small-scale distributed hydrogen production to large-scale centralized production equipment that can be directly related to renewable energy or other forms of non-greenhouse gas emissions, and electricity production.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Green Hydrogen market covering all its essential aspects.
