## Abstracts

Heart valve disease occurs when heart valves do not work properly the way they should. The heart has four valves (the tricuspid, pulmonary, mitral, and aortic valves); these valves have tissue flaps that open and close at each heartbeat. The heart valve flaps make sure blood flows in the right direction through your heart's and to the rest of your body. Birth defects, age-related changes, infections, or other medical conditions can cause one or more of your heart valves to not open fully or to let blood leak back into the heart chambers. These conditions make your heart work harder and affect its ability to pump blood.
