Abstracts

Heat cost allocator, denoting devices attached to individual radiators in buildings that measure the total heat output of the individual radiator, which available with electronic and evaporative types. Electric heat cost allocators were where one or two electronic thermo-sensors and a microcontroller are used to calculate the heat consumption of radiator by the temperature difference between the radiator and the air in a room. Evaporating style heat cost allocators were where a special, calibrated liquid in a capillary tube records the total heat absorbed from the air in addition to that output by the radiator.
