Abstracts

Hemodialysis is a process that uses artificial membrane to remove waste, such as urea, from the blood, restore proper balance of electrolytes in the blood, and eliminate extra fluid from the body. When kidney function goes below 10% to 15%, it is no longer able to filter blood. This causes toxins to build up in the body along with excess fluid. Hemodialysis is used to remove these toxins. It is an effective treatment for those suffer from chronic and acute kidney diseases along with renal failure.
