Abstracts

A nasal cannula (NC) is a device, used to provide extra oxygen to a patient or person in need of respiratory help. Nasal cannula contains a lightweight tube which then separates into two prongs, these separated prongs are placed in the nostrils of the patients and from which a mixture of air and oxygen flows. One end of the tube is attached to an oxygen supply such as a portable oxygen generator. This cannula is normally attached to the patient by the tube hooking around the patient's ears or by the elastic headband. Nasal cannula supply oxygen in a flexible manner which means the supply of oxygen depends upon the patient's breathing rate and pattern.
