Abstracts

In the financial market, High Frequency Trading (HFT) is an algorithmic transaction characterized by high speed, high turnover and high order trading ratios, using high frequency financial data and electronic trading tools. Although there is no single HFT definition, its key attributes include highly complex algorithms, co-location and very short-term investment horizons. HFT can be seen as the main form of financial algorithmic trading. Specifically, it uses advanced technology tools and computer algorithms to quickly trade securities. HFT uses a proprietary trading strategy run by a computer to enter and exit positions in seconds or fractions of a second.

Based on the High-frequency Trading market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
