Abstracts

High molecular weight polyisobutene is a solid rubberlike substance; it retains its resilient and high elastic properties and belongs to 'the elastomers' in contrast to such polyolefines as polyethylene, polypropylene, polybutene, which belong to 'thermoelastoplasts'.

High molecular weight polyisobutene is a product of the method of low temperature polymerization with evaporating liquid ethylene and in presence of catalyst boron trifluoride and together with the process regulators.

Polyisobutene is a saturated carbon-chain polymer. As such it is highly resistant to oxygen, ozone, and solutions of acids, alkalis and salts. The polymer doesn't swell or dissolve in oxygen containing polar solvents, but readily dissolved in aliphatic or aromatic hydrocarbons (passing through a swelling stage).

Based on the High Molecular Weight Polyisobutylene market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for
