Abstracts

Gases having more than 99.99% concentration are known as High Purity gases. High Purity gases are most commonly used in applications where impurity control is imperative. In high purity gases, the impurity content level is usually below 0.1 ppm. Generally, high purity gases, such as hydrogen, nitrogen, oxygen, helium, krypton and argon, among others, are classified into four groups i.e. pure gases, hydrocarbon bases gases, rare gases and miscellaneous gases. High purity gases can be manufactured through several manufacturing methods, such as cryogenic-liquefaction & air fractional distillation, pressure swing adsorption using molecular sieves, hydrocarbon steam reforming process and purification of purge gas, among others.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the High Purity Gas market covering all its essential aspects.
