Abstracts

Thermal conduction is the transfer of heat from one body to another, through contact. Heat can be transmitted by convection, radiation, and conduction. Graphite can be bifurcated into natural graphite and synthetic graphite. Thermal pyrolytic graphite is a unique synthetic graphite material produced through chemical vapor deposition (CVD) process, consists of excellent in-plane thermal conductivity (less than 1500 W/mK), and layers of stacked graphene planes. Various properties of graphite in different industry applications such as transport, defense, and medicine. These properties of graphite can likely to drive the high thermal conductivity graphite material market. High thermal resistance, low friction and self-lubrication, high electrical conductivity, high thermal conductivity, low wettability by liquid metals, and high resistance. These properties of graphite are driving the high thermal conductive graphite material market.

Based on the High Thermal Conductivity Graphite Material market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
