Abstracts

The holographic film is a very thin flexible plastic film [polyester (PET), oriented polypropylene (OPP) and nylon (Bonyl)], which has been micro-embossed and even images. Patterns (eg, grid plates or diamonds) or images (eg, tigers) are produced by embossing processes that provide significant 3-D effects and/or spectral (rainbow) colouration. The embossing process is similar to cutting tiny grooves into the film surface at various angles and shapes. These micro-embossed grooves make the 'diffraction' of normal white light an amazing spectral colour. This phenomenon is no different from the diffraction of white light into a spectral colour by a crystal prism.
