Abstracts

The holographic film is a very thin flexible plastic film [polyester (PET), oriented polypropylene (OPP) and nylon (Bonyl)], which has been micro-embossed and even images. Patterns (eg, grid plates or diamonds) or images (eg, tigers) are produced by embossing processes that provide significant 3-D effects and/or spectral (rainbow) colouration. The embossing process is similar to cutting tiny grooves into the film surface at various angles and shapes. These micro-embossed grooves make the "diffraction" of normal white light an amazing spectral colour. This phenomenon is no different from the diffraction of white light into a spectral colour by a crystal prism.

Based on the Holographic Lamination Film market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
