## Abstracts

Hormone replacement therapy (HRT), also known as menopausal hormone therapy (MHT) or postmenopausal hormone therapy (PHT, PMHT), is a form of hormone therapy which is used to treat symptoms associated with menopause in women. These symptoms can include hot flashes, vaginal atrophy and dryness, and bone loss, among others, and are caused by diminished levels of sex hormones in the menopausal period. The main hormonal medications used in HRT for menopausal symptoms are estrogens and progestogens. A progestogen is usually used in combination with an estrogen in women with intact uteruses because unopposed estrogen therapy is associated with endometrial hyperplasia and cancer and progestogens prevent these risks. Androgens like testosterone are sometimes used in HRT as well. HRT medications are available in various forms and for use by a variety of different routes of administration.

Based on the Hormone Replacement Therapy (HRT) market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
