Abstracts

A hot air balloon is a lighter-than-air aircraft made up of bags called envelopes containing heated air. Hanging below is a gondola or wicker basket (in some long distance or high air balls, a capsule) that carries passengers and heat sources, in most cases an open flame caused by burning liquid propane. The heated air inside the envelope creates buoyancy because its density is lower than the cooler air outside the envelope. Like all airplanes, hot air balloons cannot fly in the air. Unlike a balloon, the envelope does not have to be sealed at the bottom because the air near the bottom of the envelope is at the same pressure as the surrounding air. In modern sports balloons, the outer casing is typically made of nylon fabric and the inlet of the balloon (closest to the burner flame) is made of a refractory material such as Nomex. Modern balloons have been shaped into a variety of shapes, such as rocket boats and various commercial products, although traditional shapes are used in most non-commercial and many commercial applications.
