## Abstracts

Ifosfamide is positional isomer of CYCLOPHOSPHAMIDE which is active as an alkylating agent and an immunosuppressive agent. It is a synthetic analogue of the nitrogen mustard cyclophosphamide with antineoplastic activity. Ifosfamide alkylates and forms DNA crosslinks, thereby preventing DNA strand separation and DNA replication. This agent is a prodrug that must be activated through hydroxylation by hepatic microsomal enzymes. Ifosfamide is used in the treatment of several forms of cancer including lymphomas, sarcoma and advanced forms of solid organ cancer such as breast, testicular, ovarian, gastric and lung cancer. Ifosfamide therapy is associated with minor transient serum enzyme elevations and has been linked to cases of acute liver injury, including acute cholestatic hepatitis and veno-occlusive disease.
