Abstracts

An autopilot system comprises a set of devices used to control as well as guide an aircraft with no direct assistance from the pilot. While autopilot systems were earlier only capable of maintaining the altitude and heading of the aircraft, today they can control almost every function right from take-off to landing. The use of in-flight autopilot systems helps improve the accuracy of navigation and aids in reducing the consumption of fuel. Based on the In-Flight Autopilot Systems market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
