Abstracts

Indoor LBS (Location-based Services) is used to track the location of an object or people within a building, specializing in next-generation mobile solutions and new customer experiences, including indoor location-based services, mapping & way finding, in-store product search, BLE beacons proximity services, and mobile payments.

Indoor LBS is confined to a very limited geography; hence, it uses only wireless networks such as Wi-Fi and wireless local area networks (WLAN), which cover a small area. In addition, indoor LBS requires high accuracy to determine the position of the object or device. As a result, indoor LBS uses positioning technologies based on Wi-Fi, WLAN, ultra-wide band (UWB), Bluetooth, assisted global positioning system (A-GPS), microelectronic mechanical system (MEMS), and other hybrid technologies to determine the location of the searched object.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Indoor LBS market covering all its essential aspects.

For the competitive landscape, the report also introduces players in the industry from the perspective of the market share, concentration ratio, etc., and describes the leading companies in detail, with which the readers can get a better idea of their competitors and acquire an in-depth understanding of the competitive situation.
