Abstracts

An inductor is a passive two-terminal electrical component. It is made of an electrical conductor for example, a wire, normally wound into a coil. A current flowing through it will store energy temporarily in a magnetic field in the coil. If the current flowing through changes, this creates a voltage.

A transformer consists of two coils of insulated wire. In most transformers, the wires are wound around an iron-containing structure called the core. One coil (the primary), is connected to an input source of alternating current that produces a constantly varying magnetic field around the coil. This in turn, produces an alternating current in the other coil. This coil (the secondary), is connected to a separate electric circuit, to give an output.

The Inductor and Transformer market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
