## Abstracts

An Industrial Gas Spring is a type of spring that, unlike a typical metal spring, uses a compressed gas, contained in a cylinder and compressed by a piston, to exert a force.

An Industrial Gas Spring in compression is similar to a coil spring but normally much flatter. Compression Industrial Gas Springs have the rod out and the load from the application forces the rod in. Typically mounted so they are rod down in the position in which they spend the most time. This allows the oil contained within Industrial Gas Spring to lubricate the rod seals. By varying the design of the piston, seals and bearings and by modifying the quantity and viscosity of the lubricating oil can provide Industrial Gas Springs with different operating characteristics.
