Abstracts

Their performance is only possible because of these additives, the content of which may vary from under 1% for some industrial oils to more than 25% for certain metalworking lubricants. These additives are designed either to enhance the lubricants' intrinsic properties, like resistance to oxidization, wear, friction or corrosion, or to add properties they do not possess naturally, such as detergency, dispersive power or alkalinity—with a view to neutralizing acid compounds— or even 'extreme pressure' properties. Based on the Industrial Lubricant Additives market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
