Abstracts

Inorganic flame retardant is composed of a high temperature resistant solution added to the ultrafine inorganic metal oxide for fine processing. The inorganic flame retardant mainly adds the inorganic element having intrinsic flame retardancy to the flame-retardant substrate in the form of a simple substance or a compound, and is sufficiently mixed with the polymer in a physically dispersed state, and passes through the chemical or the gas phase or the condensed phase. Physical changes play a flame retardant role.

Based on the Inorganic Flame Retardants market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
