Abstracts

Insulin promotes the absorption of glucose from the blood into skeletal muscle cells, liver, and fat. The production and secretion of glucose by the liver is firmly repressed by extraordinary insulin concentrations in the blood. If the sugar level in the body is more than what is required, insulin plays a major role in storing sugar in the liver. This stored sugar is released when the blood sugar level is low or when the body requires more sugar. Diabetes affects the body's capability to process blood sugar. Gestational diabetes, type 1, and type 2 are three major diabetes types. People living with type 1 diabetes are completely dependent on insulin and have to take artificial insulin on a daily basis. Insulin has to be injected under the skin into the fatty tissue. A wide variety of devices are employed for the supply of insulin, including pens, syringes, injectors, and pumps.

Based on the Insulin Delivery Devices market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
