Abstracts

Rubber track is a type of circular tape made of rubber and fiber or metal composite materials mounted over the wheels of vehicles to assist the wheel's movement in a condition where wheels are not helpful. It is expected that rubber tracks may be substantial replacement of tires in heavy machineries used in the construction, mining, agriculture and military sectors. The intelligent rubber tracks provide better traction, with high stability, small ground pressure, low vibration, low noise floatation and durability without damaging the road at high speed. Additionally, the braking distance is greatly reduced at slippery surfaces, such as ice, mud, snow and hard surface. It is expected that the top speed of the vehicle may increase by 8–10 km/h when the acceleration is increased by 15–25%, but this phenomenon totally depends on the type of vehicle and soil. Intelligent rubber track is mainly used in dozers, pavers and excavators.
