Abstracts

An ionomer is a polymer comprising repeating units of two electrically neutral repeating units and a portion of an ionizing unit (typically no more than 15 mole %) covalently bonded to the polymer backbone as pendant moieties. This means that most ionomers are copolymers of neutral and ionized units, which usually consist of carboxylic acid groups. The classification of a polymer as an ionomer depends on the level of substitution of the ionic group and how the ionic group is incorporated into the polymer structure.

Based on the Ionomer market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
