Abstracts

Ionones are cyclocitrylildene acetones with the molecular formula $C_{13}H_{20}O$. They are an important and versatile class of aroma chemicals. They exist in two forms: alpha and B forms. Ionones are generally found in the form of a colorless to pale-yellow colored liquid and have a molecular weight of 192.3. Ionones and methyl ionones were discovered in 1893 by Tiemann, a German scientist, while investigating the compounds responsible for the fragrance of violets. This discovery changed the nature of the perfume industry, as it demonstrated that synthetic aroma chemicals could be used in fragrance formulations that until then relied exclusively on natural products. In the contemporary perfume industry, ionones and methyl ionones along with their derivatives such as iso E super, irones, koavone, timberol, and damascones are used in virtually all commercial fragrances. The ionones scent ranges from violets to a scent of soft wood mixed with violet tones.

Based on the Ionone market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
