Abstracts

All objects with temperatures above absolute zero (-273 ° C / -459 ° F) emit infrared radiation at MWIR and LWIR wavelengths (3 μm - 14 μm), which is proportional to the object temperature. Thermal imaging focuses and detects this radiation, then converts the temperature change into a grayscale image, using brighter and darker shades of gray to represent a hotter and cooler temperature, thereby visually representing the heat distribution of the scene.

Based on the IR and Thermal Imaging Systems market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail.
