Abstracts

Ironless linear motors are so named because the primary part (analogous to the stator of a rotary motor) is made of windings wrapped around laminated steel and embedded in epoxy resin. This construction method eliminates iron from the primary part, so unlike iron core motors, there are no attractive forces between the primary and secondary parts that can cause cogging and make assembly difficult. The absence of cogging, or detent forces, enables them to travel with virtually zero force and velocity ripple, meaning that they can travel not only at very high speeds with excellent positioning accuracy, they can also travel at very slow speeds with typically less than 0.01 percent speed variation.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Ironless Linear Motors market covering all its essential aspects.

For the competitive landscape, the report also introduces players in the industry from the perspective of the market share, concentration ratio, etc., and describes the leading companies in detail, with which the readers can get a better idea of their competitors and acquire an in-depth understanding of the competitive situation. Further, mergers & acquisitions, emerging market trends, the impact of COVID-19, and regional conflicts will all be considered.
