Abstracts

Ironless linear motors are so named because the primary part (analogous to the stator of a rotary motor) is made of windings wrapped around laminated steel and embedded in epoxy resin. This construction method eliminates iron from the primary part, so unlike iron core motors, there are no attractive forces between the primary and secondary parts that can cause cogging and make assembly difficult. The absence of cogging, or detent forces, enables them to travel with virtually zero force and velocity ripple, meaning that they can travel not only at very high speeds with excellent positioning accuracy, they can also travel at very slow speeds with typically less than 0.01 percent speed variation.

Based on the Ironless Linear Motors market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.
