## Abstracts

The safety release valve is typically functioned in a closed position to protect it from bursting and over pressure. Isolation valves are the opposite of safety release valves and typically operate at 100 % open and have no controlling purpose. They open to let fed water or steam flow through, and the pressure loss is very low. In the case of an emergency, such as a heating pipe rupture in a steam generator, this valve is required to be closed.

Based on the Isolation And Safety Valve market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
