Abstracts

Lactase, also called lactase-phlorizin hydrolase, enzyme found in the small intestine of mammals that catalyzes the breakdown of lactose (milk sugar) into the simple sugars glucose and galactose. In humans, lactase is particularly abundant during infancy. It is a so-called brush border enzyme, produced by cells known as enterocytes that line the intestinal walls and form the brush border (a chemical barrier through which food must pass to be absorbed). Mutations in the gene that encodes lactase may result in inherited lactase deficiency, which manifests as lactose intolerance, or the inability to digest lactose. Lactose that is not absorbed in the gastrointestinal tract undergoes fermentation by bacteria, resulting in the production of gas and intestinal distress. Based on the Lactase market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
