Abstracts

Photomasks—used during photolithography to project circuit patterns onto silicon wafers layer-by-layer—are essential to the production of semiconductors. Today, more mask layers than ever are required across the entire spectrum of semiconductor technologies. That is particularly true at the most advanced nodes, which may require an unprecedented 80-100 different masks to pattern a device; but it is also true for technologies that are far from the leading edge. A case in point: 200mm production is booming at fabs around the world for automotive, wireless, IoT and other fast-growing IC applications, and is driving significant mask demand.

Laser Mask Writer is used for photomask manufacturing, it is a maskless lithography systems using laser source. Compared with Mask writers based on electron-beam (e-beam) technology, mask makers prefer to use faster laser-based systems wherever possible, including for all but the most critical masks for advanced devices. Laser writers are also widely used to overlay second level patterns on already-patterned masks, a requirement to produce phase-shifting masks (PSMs) that enhance the process window for wafer lithography.
