## Abstracts

Laser plastic welding, also often referred to as through-transmission welding, is a process of bonding plastic using focused laser radiation. The process is very much different than traditional metal welding. The concept involves passing a focused laser beam through an upper, laser transmissive part to the interface of the two parts to be joined. The laser light is turned into heat energy as it is absorbed by the lower joining partner. The heat created at the interface creates a molten weld seam and the two plastics are fused.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Laser Plastic Welding market covering all its essential aspects.
