Abstracts

There are four major requirements for a separator in a flooded lead-acid battery: prevent shorting between electrodes; stable in sulfuric acid; allow ionic conduction without dendrite growth; provide mechanical spacing between electrodes.

Historically, lead acid battery separators have included cellulose, polyvinyl chloride, organic rubber, and polyolefins. Today, most flooded lead acid batteries utilize “polyethylene separators” — a misnomer because these microporous separators require large amounts of precipitated silica to be acid-wettable. Silica is responsible for the separator’s electrical properties; polyethylene is responsible for the separator’s mechanical properties. The porosity range for polyethylene separators is 50-65%.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Lead Acid Battery Separator market covering all its essential aspects.
