Abstracts

There are four major requirements for a separator in a flooded lead-acid battery: prevent shorting between electrodes; stable in sulfuric acid; allow ionic conduction without dendrite growth; provide mechanical spacing between electrodes.

Historically, lead acid battery separators have included cellulose, polyvinyl chloride, organic rubber, and polyolefins. Today, most flooded lead acid batteries utilize “polyethylene separators” — a misnomer because these microporous separators require large amounts of precipitated silica to be acid-wettable. Silica is responsible for the separator’s electrical properties; polyethylene is responsible for the separator’s mechanical properties. The porosity range for polyethylene separators is 50-65%. Based on the Lead Acid Battery Separator market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.

In chapters 8-13, we update the timely industry economic revitalization plan of the country-wise government.
