## Abstracts

In biology and biochemistry, a lipid is a biomolecule that is soluble in nonpolar solvents. Non-polar solvents are typically hydrocarbons used to dissolve other naturally occurring hydrocarbon lipid molecules that do not (or do not easily) dissolve in water, including fatty acids, waxes, sterols, fat-soluble vitamins (such as vitamins A, D, E, and K), monoglycerides, diglycerides, triglycerides, and phospholipids. Lipid has a functional and significant role in the food because of its contribution to palatability, satiety, and nutrition. Consequently, quality of the lipid is a concern among consumers due to its association with numerous health problems. Lipid oxidation is a major problem in many areas of the food industry. Delaying lipid oxidation not only prolongs the shelf-life of a product, but also decreases raw material waste, nutritional loss, and widens the range of lipids that can be used in particular products.
