Abstracts

The cathode material in the lithium-ion battery is the major component, which determines the energy density of the cell. This energy density is measured using cell voltage or cell capacity. The working mechanism of the lithium-ion battery is based on intercalation and deintercalation compounds, where the lithium ions from the cathode are introduced into the anode during the charging of the battery and extracted during discharge of the battery, with a minimal structural change in the anode. The selection of cathode material depends on various factors such as cell voltage, capacity, energy & power capabilities, cycle life, and operating temperature. Various materials are used in the cathode of a lithium-ion battery such as cobalt, manganese, phosphate, nickel cobalt manganese (NCM OR NMC), lithium iron phosphate (LFP), and others. Based on the Lithium-Ion Battery Cathode Material market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
