## **Abstracts**

Loop-mediated isothermal amplification is a single-tube technique used to amplify DNA. This may be used as a low-cost alternative to detecting certain diseases in the future. It can be combined with a reverse transcription step to allow detection of RNA. LAMP is an isothermal nucleic acid amplification technique. In contrast to the polymerase chain reaction technique in which the reaction is carried out through a series of alternating temperature steps or cycles, isothermal amplification is carried out at a constant temperature and does not require a thermal cycler.

Based on the Loop-mediated Isothermal Amplification (LAMP) market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
