Abstracts

Mechanical vapor recompression (MVR) is an energy recovery process where energy is added to low-pressure vapor by compressing it to higher pressure. The result is a smaller volume of vapor at a higher temperature and pressure, which can be used to do useful work. Typically, the compressed vapor can be used to heat the mother liquor to produce the low-pressure vapor.

In MVR system evaporated vapors are compressed with the help of external energy say Compressor/Blower/Fan. The pressure of vapor is increased, with the increase in the vapor pressure condensation temperature of the vapor will increase. The higher-pressure vapor is used to further evaporate solvent from the mixture by exchanging its latent heat. In MVR system complete latent heat of vapor is utilized. Mechanical vapor recompression system (MVR) has potential to reduce thermal energy cost by more than 90%.
