## Abstracts

An analogue front-end, also known as an analogue front-end controller or AFE, is a collection of analogue signal conditioning circuitry that uses sensitive analogue amplifiers, frequently operational amplifiers, filters, and occasionally application-specific integrated circuits for sensors, radio receivers, and other circuits to provide the flexible and programmable electronics functional block required to connect a variety of sensors to an antenna, an analog-to-digital converter, or, in some cases, a microcontroller. An analogue front-end system often has well-defined input signal characteristics, dynamic range, and needed data rate while reducing power consumption. Medical analogue front-end such as 4-channel AFE, 16-channel AFE and 32-channel AFE is built for a specific medical application such as ultrasound imaging, vital sign sensing, etc. In general, medical AFEs include analogue amplifiers, operational amplifiers, filters, sample and hold circuits, and sometimes even application-specific integrated circuits (ASICs).
