## Abstracts

Melanocortin 4 receptor is a protein that in humans is encoded by the MC4R gene. It encodes the MC4 protein, a G protein-coupled receptor that binds  $\alpha$ -melanocyte stimulating hormone ( $\alpha$ -MSH). In murine models MC4 receptors have been found to be involved in feeding behaviour, the regulation of metabolism, sexual behaviour, and male erectile function. In 2008, MC4R mutations were reported to be associated with inherited human obesity.[citation needed] They were found in heterozygotes, suggesting an autosomal dominant inheritance pattern. However, based on other research and observations, these mutations seem to have an incomplete penetrance and some degree of codominance. It has a prevalence of 1.0–2.5% in people with body mass indices greater than 30, making it the most commonly known genetic defect predisposing people to obesity.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Melanocortin Receptor 4 market covering all its essential aspects.
