Abstracts

Metallic stearates are long chain fatty acid compounds with metals of different valencies. Metallic stearates can be used for a wide range of applications, owing to their versatile properties, such as lubrication, separating properties, water repellence, gelling, stabilising, foam inhibition, and others. Metallic stearates have high melting points and are thermostable in nature. They are mostly derived from animal or plant based fatty acid sources. Aluminium and magnesium stearates are widely being used as stabilizing agents in many suspensions. Metallic stearates are used as lubricating agents in the plastics processing industry. They provide excellent resistant to colour degradation at elevated temperatures. Moreover, Zinc stearates are used as mould release agents in a number of applications.

Based on the Metallic Stearates market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
