Abstracts

Metamaterial Medium is defined as a macroscopic composite having a man-made, three dimensional, and periodic cellular architecture designed to produce an optimized combination, not available in nature, of two or more responses to a specific excitation. It possesses exceptional physical properties such as negative permeability and permittivity, and is often regarded as artificial medium with negative refractive index. The most efficient metamaterial medium possesses zero permeability and permittivity, and thus are best used to manufacture antennas to achieve high directivity. A metamaterial medium provides super-resolution in the far-field across image magnification, negative refraction of wavelengths, and enhanced spontaneous emission. Negative index metamaterial medium is an effective medium since it is made up of ordered macroscopic material, generally synthesized from the bottom up and yields emergent properties beyond its components as a single entity.

Based on the Metamaterial Medium market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
