## Abstracts

Microcarriers are microspheres with a diameter of 60~250um, which are suitable for the growth of adherent cells. Generally, dextran is used as the matrix material. Microcarrier culture means that the microcarrier is added to the culture container to enable cells to adhere to and grow on the surface of the microcarrier, and the microcarrier is always suspended by continuous stirring

Microcarriers have become the most commonly used and effective carrier for animal cell culture. Compared with traditional cell culture technology, microcarriers not only serve as the carrier for adherent cells, but also have large specific surface area, high cell yield per unit volume of culture medium, simple monitoring and control of cell growth environmental factors, high utilization rate of culture medium, small space occupied by the culture system, and simple harvesting process of cells or cell products, The utility model has the advantages of cell-free filtration, less pollution, and easy cell growth. Microcarriers are widely used in the preparation of rabies vaccine, poliomyelitis vaccine, influenza vaccine, and related vaccines (inactivated vaccine)
