Abstracts

Microducts are small conduits for housing microcables. CommScope microduct sizes include 10 mm, 12.7 mm and 16 mm that can house up to 144 fiber counts. Microducts can be used in fiber-to-the-home (FTTH), fiber-to-the-business (FTTB), long-haul, backhaul, premise fiber deployments and nearly any location where traditional conduit installations occur. The advantage they provide is that microducts can be pre-installed within a larger conduit, or simply pushed into existing conduits already in place. Microducts can also be configured in arrays or multiple units as well as single ducts. Operators may solve today's needs without microducts by pulling standard cables into an existing conduit, but pulling additional cables later may be difficult or, in some cases, impossible.

Based on the Microduct market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.
