## Abstracts

A microgrid can be defined as a local grid that can be connected to and disconnected from a traditional utility grid to provide better reliability and grid resilience. A microgrid is the interconnection between a distributed energy source and a load within a well-defined electrical boundary. It acts as a controllable entity. Microgrids can operate autonomously because they are very useful during mains grid failures and they can help mitigate the risks caused by grid disturbances and faults. Since the microgrid can be easily connected to and disconnected from the mains, it can operate in grid-connected and island mode.

Based on the Microgrids market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
